

User Monitor System

Official Project Overview & Feature Documentation

About the User Monitor System

The **User Monitor System** is a sophisticated, all-in-one platform designed to help modern organizations understand how their teams work. Whether your team is remote, hybrid, or in-office, this system provides the transparency and insights needed to boost focus, manage workloads fairly, and ensure high-level productivity across the board.

What is the User Monitor?

At its core, the system is a **digital workspace assistant**. It helps managers see "the big picture" of their team's activity while giving employees tools to manage their own schedules, breaks, and output.

Unlike old-school tracking, this platform is designed for **transparency**. Employees can see exactly what data is being shared, and managers use this data to identify burnout, reward high performers, or help those who might be struggling with time management.

Access Levels & Three Logins

The system is organized into three distinct "levels," each with its own specialized login and dashboard experience to ensure users only see what they need.

- 1. SuperAdmin Login (The Platform Owner)**

Who it's for: High-level system administrators who manage the entire platform.

- **Experience:** A master control panel to oversee all organizations, manage subscriptions, and monitor global system health.

- 2. Organization Admin & Manager Login (The Leadership)**

Who it's for: Business owners, HR managers, and Team Leads.

- **Experience:** Full visibility into their specific company or team. They use this login to set company-wide tracking rules, view employee timelines, manage breaks, and generate reports.

- 3. Employee & User Login (The Team Member)**

Who it's for: Every staff member being tracked.

- **Experience:** A personal dashboard focused on their own productivity. They use this login to view their own stats, manage their profile, and connect with the Desktop Agent for daily work.
-

The Desktop Agent (Your PC Assistant)

The **Desktop Agent** is the heart of the monitoring system. It's a lightweight application (often installed as an `.exe`` on Windows) that runs quietly on your computer to track work progress without interrupted your workflow.

- **Automatic Tracking:** Detects when you're active or idle without you having to click anything.
 - **Local Intelligence:** Even if your internet goes down, the agent keeps tracking your work and syncs
-

everything once you're back online.

- **Low System Impact:** Designed to be extremely light, so it won't slow down your computer or apps.
 - **Visibility:** A simple interface shows you if the agent is currently "In Work" or "On Break."
-

Automated Screen Captures (Verification)

The system uses randomized periodic screenshots to provide a visual log of your workday accomplishments.

- **Frequency:** Organization admins decide the interval (e.g., a snapshot every 5 or 10 minutes).
 - **Privacy Awareness:** Screenshots are only taken when you are officially "In Work" mode.
 - **Visual Proof:** Helps managers see the complexity of the tasks you're handling and provides proof of work for billing or performance reviews.
-

Customization & Control Center

Every organization works differently, so the system provides deep customization options:

Organization Custom Settings

Admins can define organization-wide rules on the **Settings Page**:

- **Screenshot Policy:** Turn screenshots on or off for the entire company.
- **Idle Thresholds:** Set how many minutes of inactivity should trigger an "Idle" status.
- **Feature Toggles:** Enable or disable specific features like AFK tracking or specialized break types.

User-Specific Overrides

We recognize that "one size doesn't fit all." Managers can customize features for individual users:

- **High-Trust Roles:** Disable screenshots for senior management while keeping them active for other roles.
 - **Specific Breaks:** Allow certain employees (like those with specific health needs) to have custom break types or durations.
 - **Custom Intervals:** Adjust how often data is captured for specific high-stakes projects.
-

SuperAdmin Master Panel

For the highest level of oversight, the **SuperAdmin Panel** is a dedicated area for platform owners (the people running the entire system across multiple companies).

- **Organization Management:** Create, suspend, or upgrade entire company accounts.
 - **Platform Health:** Monitor system performance and storage usage globally.
-

- **Database Optimization:** Keep the system fast by managing and cleaning up old logs and large files across all organizations.
-

A Tour of the Application (The Pages)

Management Dashboards

- **Main Dashboard:** The "Command Center" showing a real-time summary of who is online, current productivity scores, and recent activity snapshots.
- **SuperAdmin Overview:** For the platform owners to manage multiple companies, monitor system health, and adjust global settings.

People & Teams

- **Users Page:** A full directory of all employees with their roles and contact info.
- **Teams Page:** Organize users into functional groups for easier reporting and management.
- **Team Comparison:** A high-level view that compares the performance metrics of different teams to identify top-performing departments.

Productivity & Activity

- **Timeline View:** A beautiful, color-coded bar chart of an employee's day, showing exactly when they worked, took breaks, or were idle.
- **App Usage Dashboard:** Visual charts showing which applications (like Slack, Excel, or Chrome) are consuming the most time.
- **App Mapping & Categories:** Allows admins to define which applications are considered "work-related."
- **Activity Logs:** A granular list of every action logged by the system for deep-dive investigation.

Insights & Results

- **Reports Page:** Generate professional documents for payroll or performance reviews, summarizing hours worked, breaks taken, and overall focus.
- **Breaks Page:** View and manage the history of all employee breaks to ensure compliance and wellness.

Personal Workspace

- **Profile Page:** Where employees can manage their own information and see their personal daily stats.
 - **Settings:** Adjust system preferences, notification styles, and organizational rules.
-

Detailed Features

1. Smart Productivity Tracking

The system automatically learns how you work. It detects when you are actively using your computer and when you've stepped away, categorizing time into:

- **Active Work:** When you are focused and interacting with your apps.
- **Idle Time:** When the computer is on but no interaction is detected.
- **AFK (Away From Keyboard):** When you are officially away from your desk.

2. Application & Website Insights

The platform tracks what software and websites are being used most frequently.

- **Categorization:** Group apps into "Productive," "Neutral," or "Non-Productive."
- **Trend Analysis:** See if the team is spending too much time in meetings vs. actual deep work.

3. Advanced Break Management & Groups

Ensures employees are taking healthy breaks throughout the day while keeping policies organized:

- **Custom Break Types:** Define specific breaks like "Tea Break," "Lunch," or "Meeting."
- **Break Groups:** Group multiple break types together (e.g., "Full-Time Shift Group" or "Night Shift Group"). This allows you to manage different break rules for different departments.
- **Assign Group:** Once a break group is created, it can be easily **assigned to specific teams or individual users**. This ensures the correct policies (like paid vs. unpaid durations) are applied automatically to the right people.
- **Paid vs. Unpaid:** Automatically calculates how break time affects total work hours based on the assigned group rules.

The Tech Behind the System (Basics)

The User Monitor is built using modern, industry-standard technologies to ensure it is fast, secure, and reliable:

- **Interface (Dashboard):** Built with **React**, a leading technology for creating fast and responsive web apps.
 - **Brain (Backend):** Powered by **Node.js**, designed to handle massive amounts of real-time data efficiently.
 - **Storage (Database):** Uses **PostgreSQL**, one of the most reliable and secure databases for protecting your sensitive company data.
 - **Desktop App:** Built with **Electron**, allow the same app to run seamlessly on both Windows and Mac.
-

System Requirements & Planned Improvements

The current version of the User Monitor is optimized for its core performance tracking. However, we have several major enhancements planned for future phases to provide even deeper organizational insight.

Camera Monitoring (High Priority)

A planned feature to capture **periodic webcam snapshots** or optional live monitoring. This will provide a visual anchor for remote work verification and physical presence detection.

Planned System Gaps & Roadmap

- **Employee Management:** Expanding from basic details to full employee profile lifecycles.
- **Advanced Teams:** Introducing Team Lead (TL) and Department Head oversight structures.
- **Campaign Management:** Specialized tracking for campaign-based or project-based work.
- **Payroll & Attendance:** Future integration to automatically calculate payroll based on verified work hours and attendance logs.
- **Role Granularity:** Expanding the system to include more specialized roles beyond Admin and Employee.

Note: This document is a non-technical guide for stakeholders and administrators. It is ignored by the main code repository.
